ANNEXURE-3**TECHNICAL SPECIFICATIONS****1. INSTALLATION OF JOINT CLOSURE & SPLICING OF OFC:-**

Fusion splicing is used for splicing the optical fibre in BSNL network. This is accomplished by applying localized heating (i.e., by electric arc or flame) at the interface between two butted, pre-aligned fiber ends, causing them to soften and fuse together. For this purpose fusion splicing machine is used.

There are various types of joint closures in use for BSNL, namely SJC (Straight Joint Closure) and BJC (Branch Joint Closure). The SJCs are predominantly used along the cable routes, and the BJCs are used where ever, the fiber toppings and branching of cable is required. The Procedure for assembly of joint closures is generally supplied by the manufacturers along with the joint closures. However the general procedure for assembly of joint closure is described below:

1.1 JOINTING OF CABLE

The manufacturer's manual contains the following:

- a) Material inside joint closure kit.
- b) Installation tools required.
- c) Detailed procedure for cable jointing.
- d) Procedure for re-opening the closure.

1.2 However, generally, the following steps are involved for jointing of the cable.

- a) Preparation of cable for jointing.
- b) Stripping/cutting the cable.
- c) Preparation of cable and joint closure for splicing.
- d) Fiber splicing.
- e) Organizing fibers and finishing joints.
- f) Sealing of joint closure end.

- g) Placing joint in pit.
- h) Marking of cable end.
- i) Marking of fibers in tray.

1.3 PREPARATION OF CABLE FOR JOINTING:-

- 1.3.1 During the installation, a minimum of 10 meters of cable of each end is coiled in the jointing pit to provide for jointing to be carried out at convenient location as well as spare length to be available for future use in case of failures.
- 1.3.2 The pit size must be chosen carefully to ensure the length of the way on which joint is mounted is greater than closure length plus twice the minimum bending radius of the cable. A pit length of 1.2 meter is sufficient for most of the cable and joint closures. Bracket to support the cable coil are also fixed on the wall of the pit.
- 1.3.3 The cable is then coiled on to the pit wall in the same position as required after the joint is complete. The marking is done on all the loops so that it will be easier to install it later.
- 1.3.4 The distance from the last centre to the end of the cable must be at least 1.8 meter. This is being the minimum to be stripped for preparation of joint.
- 1.3.5 Sufficient cable at each end up to the jointing vehicle/enclosure is then uncoiled from the pit for jointing.

1.4 STRIPPING/ CUTTING OF THE CABLE:

- 1.4.1 The cable is stripped of their outer and inner sheath with each sheath, staggered approximately 10mm from the one above it.
- 1.4.2 Proper care must be taken when removing the inner sheath, to ensure the fibers are not scratched or cut with the stripping knife or tool. To prevent this, it is best to only score the inner sheath twice on opposite sides of the cable, rather than cut completely through it. The two scores marking on either side of the cable are then stripped of the inner sheath by hand quite easily.
- 1.4.3 The fibers are then removed from cable one by one and each fiber is cleaned individually using isopropyl solution to remove the jelly.

1.5 PREPARATION OF CABLE JOINT CLOSURE FOR SPLICING:

The type of preparation work performed on the cable prior to splicing differs on the type of joint closure and fiber organizer used. However, the following steps are usually common:

- 1.5.1 The strength member of each cable is to be fixed to the central frame of the joint.
- 1.5.2 The sealing compound or heat shrink sleeve is applied to the cables and closure or prepared for application after splicing is complete.
- 1.5.3 The fibers are protected (usually with plastic tubing) in their run from the cable core to the fiber organizer trays (particularly if cable construction is slotted core type). Two Nos of plastic tie shall be used to hold fiber tube with splicing tray.
- 1.5.4 Tags which identify the fibers numbers are attached at suitable locations on the fibers.
- 1.5.5 Splice protectors are slipped over each fiber in readiness for splicing over the bare fiber after splicing.

1.6 STRIPPING AND CLEAVING OF FIBRE:

- 1.6.1 Prior to splicing each fiber must have approximately 50mm of its primary protective U.V. cured coating removed, using fiber stripper which are manufactured to fine tolerances and only score the coating without contacting the glass fiber.
- 1.6.2 The bare fiber is then wiped with a lint free tissue doused with ethyl alcohol.
- 1.6.3 Cleaving of the fiber is then performed to obtain as close as possible to a perfect face on the fiber.

1.7 FUSION SPLICING OF THE FIBRE:-

Some of the general steps with full automatic micro processor control splicing machine/ribbon type splicing machine are as under:

- 1.7.1 Wash hands thoroughly prior to connecting this procedure.
- 1.7.2 Place the bare fiber inside 'V' groove of the splicing machine by opening clamp handle such that the end of fiber is app.1 mm. over the end of the 'V' groove towards the electrodes.
- 1.7.3 Repeat the same procedure for other fiber, however first insert heat shrink splice protector.
- 1.7.4 Press the start button on the splice controller.
- 1.7.5 The machine will pre fuse, set align both in 'X' and 'Y' direction and then finally fuse the fiber.
- 1.7.6 Inspect the splice on monitor if provided on the fusion splicing machine and assure no nicking, bulging is there and cores appear to be adequately aligned if the splice does not visually look good repeat the above procedure.
- 1.7.7 Slide the heat shrink protector over the splice and place in tube heater. Heat is complete when soft inner layer is seen to be 'oozing' out of the ends of the outer layer of the protector.
- 1.7.8 Repeat the same procedure for all the other fibers.

1.8 ORGANISING FIBRE AND FINISHING JOINTS:-

- 1.8.1 After each fiber is spliced, the heat shrink protection sleeve must be slipped over the bare fiber before any handling of fiber takes place, as uncoated fibers are very brittle and cannot withstand small radius bends without breaking.
- 1.8.2 The fiber is then organized into its tray by coiling the fibers on each side of the protection sleeve using the full tray side to ensure the maximum radius possible for fiber coils.
- 1.8.3 The tray is placed in the position.
- 1.8.4 OTDR reading taken for all splices in this organized state and recorded on the test sheet to confirm that all fibers attenuation are within 0.1 db per splice. This OTDR test confirms fibers were not subjected to excessive stress during the organizing process.
- 1.8.5 The splice loss measurement on each to fiber is also to be taken from the terminal station using power meter to determine the splice loss of each fiber < 0.1 db.
- 1.8.6 Only after satisfactory confirmation of the splice loss within limits i.e. 0.1 db using power meter, the joint pit is to be closed with proper sealing,

1.9 PLACING OF COMPLETED JOINT IN PIT:-

- 1.9.1 Joint is taken out from the vehicle/splicing location and placed on the tarpaulin provided near the pit.
- 1.9.2 The cable is laid on the ground; coil the cable such that pen mark previously placed on the cable line up. Tape these loops together at the top of the coil.
- 1.9.3 The joint can now be permanently closed and sealed by heating heat shrinkable sleeve etc.
- 1.9.4 If required for attending to faults etc., manufacturers supply special kits for opening of the joint and the steps to be followed. However the general steps are as under:
 - a) Using suitable knife cut heat shrink sleeve longitudinally along its entire length.
 - b) Do not damage the smaller heat shrunk sleeve on the ends of the joint.
 - c) Apply heat to the cut sleeve until it begins to separate.
 - d) Gently remove the cut sleeve from the joint. Now the joint can be opened.
 - e) Protective sleeve/cover can be removed for attending to faults etc.

1.10 EXCAVATION AND BACK FILLING OF TRENCHES FOR ATTENDING TO FAULTS:

- 1.10.1 It is recommended that excavation of trench be done manually, since use of mechanical devices like JCB likely to damage existing cables other utility pipes etc.
- 1.10.2 The excavation shall include excavation of trial holes clearing bushes and roots of trees along the trenches.
- 1.10.3 During excavation of the trenches, the earth shall be thrown by the side of the trenches. Complete excavated earth shall be back filled in the trench after laying the cable and well rammed.
